iFinder GDPR

Data protection compliant with iFinder GDPR

Know where personal data is slumbering in the company and become active in a targeted manner

For many companies it is still a great challenge to meet the requirements of the European data protection regulations. Personal data can be easily identified in an ERP or CRM system. But what about data sources such as file servers or e-mail systems where a lot of unstructured data is stored? How do you find the relevant data and make sure that nothing is overlooked? And how do you know which stored data is relevant with regard to the implementation of the General Data Protection Regulation (GDPR)?

INTRAFIND

To remain inactive is not an alternative. This is all the more serious as the authorities now impose severe penalties for violations.

i

Acting instead of reacting: personal data always at hand

iFinder GDPR helps companies to comply with the European Data Protection Directive. The software supports them in searching internal data sources such as file servers, CMS, DMS, wikis or email systems specifically for GDPR-relevant content.

The tool analyzes the data stocks and lists all directories and files containing personal data so that these files can then be efficiently processed further.

iFinder GDPR covers these scenarios:

▶ **Request for information**
Comprehensive determination of all stored personal data in the event of a request for information to hand over a list to the data protection officer. This enables you to obtain information within minutes, meet deadlines and also delete data subsequently.

▶ **Analysis of any personal data :**
You can thus flexibly find everything containing personal data. You select the relevant personal aspects such as personal names, dates of birth, addresses, telephone numbers, e-mail addresses, etc. and receive, for example, a list of your „toxic" documents relevant to the GDPR, sorted by frequency of occurrence. This includes, for example, lists of employees or customers whose existence you did not know about until now. The search via intelligent search filters allows you to flexibly access relevant information and to consolidate and evaluate your data piece by piece.

▶ **iFinder GDPR enables 360° analysis**
The tool also helps you to clean up in later steps and to complete your GDPR process directory in a watertight way. You prove that you have done everything that you possibly can with an advanced analysis solution to comply with your legal obligations.

▶ **Additional tool for copying, moving or deleting**
After the intelligent identification of relevant data, it can be moved, deleted or copied with an additional tool which is part of the iFinder GDPR package. You will receive a confirmation of this action, which greatly simplifies the documentation.

Your advantages:

+ You can quickly and easily obtain a comprehensive overview of where personal data is stored on your file shares or in other data sources.

+ You complete your GDPR procedure index.

+ You act in compliance with data protection and do not overlook anything.

The tool supports you in your GDPR-relevant data management processes and is an important building block to give you and your management the certainty that no **personal risks** are lurking in your extensive unstructured file stores.

A whole range of possible personal data - from personal names, birth and contact details to vehicle registration numbers or IBAN numbers - is already stored in the system. The system is therefore pre-trained and cold-startable. A further individual adaptation of your contents, e.g. of your individual customer contract numbers, is possible without any problems.

Scalable for the future

The more than 80 connectors for connecting to other systems and the more than 600 different document formats that the Enterprise Search solution can process make it possible to implement your requirements for a comprehensive analysis platform with an established standard product. The system knows no limits regarding the amount of data you want to analyze. Even one billion objects can be analyzed without any problems, with the appropriate hardware. The solution also includes a unique, vendor-certified interface to NetApp file shares, which allows infinite amounts of data to be processed in real-time.

A great side effect: You can easily extend the iFinder GDPR to a second application by configuring search profiles: the **company-wide, intelligent and rights-checked search for all employees**. Of course, these employees do not search with the GDPR features, but use the search to quickly access relevant knowledge and thus save time and costs.

Our service - installation and operation according to your wishes

On premise, as a Managed Service or as SaaS

No matter which operating mode you prefer for the iFinder GDPR - we deliver the desired model. Most customers want to run the analysis solution in their own company. No problem! We support this by easy installation and simple, non-time consuming administration. You can operate the solution yourself or use our experienced Managed Service for this purpose. Customers, who e.g. only want to analyze data stocks temporarily, can also use the iFinder GDPR in the SaaS version in a German ISO27001 certified data center.

> **We have 20 years of product and project experience with search software. 1000 satisfied end customers speak for the mature solution. We are listed in the Gartner Magic Quadrant for Insight Engines - so you make a safe investment decision. Please contact us!**
